Products affected by EN40

- Straight columns for lanterns up to 20 metres. Post top mounted.
- Columns for side entry luminaires up to 18 metres.

Under the condition of EN40 all of the above must be labelled CE.

Administrative Zones

The administrative zone approach is designed to ease the burden of calculating complex calculations for every situation and configuration of luminaire and bracket.

The region wind zone and maximum height related to a zone are assigned to cover the main inhabited areas and main roads within the zone.

Specific guidance should be sought for the following situations:

- Site altitudes above those specified in PD6547
- Elevated sites eg. bridges car park top decks.
- Known wind funnelling sites Within 5km of the coast

miniguide

The Sites

Terrain Category I

Sea sides. At the edge of a lake with a length exposed to the wind of at least 5km. Flat even land without obstacles.

Terrain Category II

Fences off cultivated land, some small agricultural buildings, houses or trees.

and forests

Industrial or sub-urban zones

Terrain Category III

Terrain Category IV

Urban perimeters with at least 15% of the surface built on and/or on which the average of buildings exceed 15m.

Critical Points Related to Structural Strength

- The point at which the column is fixed.
- The lower edge of the door opening.
- For tapered lighting columns the top of the door opening.
- The point at which the bracket begins or the point at which the bracket is attached if bracket is detachable.
- Transition from one diameter to another when column is stepped
- Any critical position (change of material thickness).

For simplicity, Holophane have grouped lighting columns for administrative areas designated in PD 6547 table A.1, for Light Wind Zones and Medium Wind Zones under one reference, LMZ. For Heavy Wind Zones the reference is HVZ and for Extra Heavy Wind Zones the reference is HEZ.
